The solution of this problem is performed in three stages: in the first stage, the set of problems is converted to a set of enlarged problems with identical solution times; in the second stage the realization of problems in the system is planned for the new set of problems; in the third stage, the results of the first two stages are used to select a strategy for realization of the initial set.

"The Structural Complexity and Technical Realization of Formal Neurons
Using Magnetic Flux Switches"

Probl. Bioniki. Resp. Mezhved. Temat. Nauch.-Tekhn. Sb. [Problems of
Bionics. Republic Interdepartmental Thematic Scientific and Technical
Collection], 1973, No 10, pp 3-15 (Translated from Referativnyy Zhurnal
Kibernetika, No 10, 1973, Abstract No 10V801)

Translation: Problems of the technical realization of multifunctional
and monofunctional formal neurons are discussed. The general structural
complexity of the following types of formal neurons is analyzed: with
blocking fibers, with permitting fibers, with combining fibers and with
combinations of spontaneous and blocking fibers. 11 Biblio. Refs.

"A Multifunctional Threshold Element"

Moscow, Otkrytiya, Izobrcteniya, Promyshlennye Obraztsy, Tovarnyye Znaki,
No 10, Apr 72, Author's Certificate No 332575, Division H, filed 13 Jul 70,
published 14 Mar 72, p 225

Translation: This Author's Certificate introduces a multifunctional threshold element based on magnetic cores with rectangular hysteresis loop. The element operates in accordance with the principle of current distribution, and contains a unit for setting the threshold value, and also threshold cores carrying series-connected windings for recording the weight coefficients of variables and threshold windings. As a distinguishing feature of the patent, the logic possibilities are extended by adding units for input of the code for weight coefficients on the threshold cores. The distribution windings of the units for recording the weight coefficients on the threshold cores and of the unit for setting the threshold value are con-

DISCUSSION OF DISPERGATION COEFFICIENTS OF TELLURIUM AND ZINC FOR CRYSTALLIZATION
OF GSB-TECH HEATS

Article by N. S. Mirgalovskaya, I. A. Sretenskaya, A. I. Lopatin, T. F.
Ushatayev. In: "Sistemnye issledovaniya po tekhnologii rastvorov i poluproduktov".
Editor: V. V. Kostylev. Naukova Dumka, Kiev, 1971, p. 761

Experimental studies were made of the distribution coefficients of starting materials by the
method of GSB-TECH. It was demonstrated that in contrast to the Cu-Al-Zn
system, the dependence of the distribution coefficient of both alloying elements
on the composition of the GSB-TECH melt is characterized by strong negative
deviations from the additive straight line. In the case of tellurium the curve
passes through a minimum. This behavior of tellurium and zinc is obviously
connected with the appearance of "reform"-like structures.

Experiments were made of the viscosity and the electrical
conductivity of liquid solutions of GSB-TECH. The existence of singular
peaks corresponding to compositions of 31.3 and 50.6 mole indicates the
presence in a broad temperature range was detected. It was established that
diluted series of osmotic pressure of the melt which is characterized by negative
deviations from the law of ideal solutions which make the formation of association
of atoms in the GSB-TECH solutions thermodynamically possible.

"Electrical Properties of p-Aluminum Antimonide Single Crystals"

Ashkhabad, Izvestiya Akademii Nauk Turkmeneskoy SSR, Seriya Fiziko-Tekhnicheskikh, Khimicheskikh i Geologicheskikh Nauk, No 6, 1971, pp 9-14

Abstract: The authors studied the electrical properties of p-aluminum antimonide single crystals grown by the Czochralski method. The material was synthesized and the crystals were pulled in the same installation in a helium atmosphere. The specimens cut from the ingots measured approximately 2-2.5 x 3-4 x 12 mm. Platinum or molybdenum probe-leads were attached by spark-discharge welding. The wire leads were 0.05 mm in diameter. The electrical conductivity and Hall effect were measured by the compensation method, using direct current, at temperatures of 80-1300°K. The carrier (hole) concentration of the specimens was $4.6 \cdot 10^{17} \text{ } 2 \cdot 10^{18}/\text{cc}$. No inversion in the sign of the Hall coefficient was observed throughout the entire temperature range. The width of the forbidden band was found to be 1.61 eV in the region of intrinsic conductivity, and the acceptor level was found to be approximately 0.02 eV in the region of extrinsic conductivity.

DEVELOPMENT OF CRACKS DURING WELDING OF ER100 ALLOY

Institute by Candidate of Technical Sciences V. P. Moiseenko, Engineer L. A. Semeonchukova; Moscow, Russia;
Engineer O. G. Krasnov, Engineer O. A. Semochukova; Moscow, Russia;
Institute by Candidate of Technical Sciences V. P. Moiseenko, Engineer L. A. Semeonchukova; Moscow, Russia;
Institute by Candidate of Technical Sciences V. P. Moiseenko, Engineer L. A. Semeonchukova; Moscow, Russia;

Thermally hardened nickel-based EP19 alloy, alloyed with chromium, molybdenum, is used extensively for welded assemblies intended for operation in aggressive media at temperatures up to 450°C. According to operating conditions cracks are not permitted to form in weld seams. Welding experience indicates, however, that the most frequent defects are transverse cracks in the near-seam zone, appearing at the points of closing of round seams with square and similar seams, and also at the intersection of round seams with square and similar seams. These eliminate by auxiliary welding increases weld deformation and the amount of labor involved in manufacturing the products.

One of the causes of microcracks in the near-seam zones of such seams, as is known [1], is the low plasticity of zones of the metal enriched with carbon and their inadequate resistance to the formation of cracks at the weld edges.

The total amount of transverse transverse and the character of its distribution depend on the degree of overheating of the metal during welding, and the time it spends at the dangerous temperature, i.e., on the rate of welding.

To meet the purpose of selecting the welding conditions, round heads were formed for the purpose of selecting the welding conditions of welding assemblies of EP19 alloy. The round form made it possible to simulate the unfavorable conditions of heating of full-scale parts. The methods and conditions of argon-arc welding with a nonconsumable electrode are presented in Table 1. Metallographic analyses of samples cut from various parts of the seam (Figure 1) revealed the amount of eutectic formed, its distribution in the various parts of the near-seam zone and its influence on the formation of cracks.

The presence of a eutectic component of linear character was noted at a distance of 0.01-0.025 mm from the line of fusion in all specimens.

"A Check Valve for up to 20 kbar"

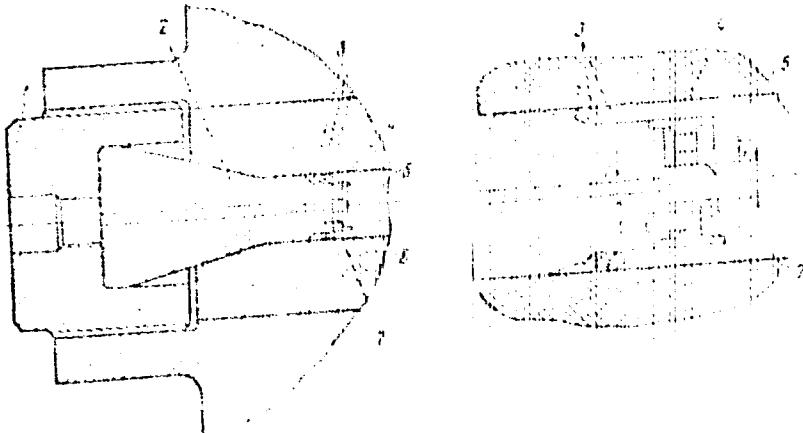

Moscow, Pribory i Tekhnika Eksperimenta, No 2, Mar/Apr 72, p2 193-194

Abstract: The article describes a check valve for up to 20 kbar with flat contact surfaces. The valve is diagrammed in the figure. The valve body 2 is made of hardened KhVG steel and has a shut-off orifice of 1.5 mm. The orifice is closed by cap 7 prestressed with low force by plate spring 5 and centered in sleeve 4 which is held in the valve body by screws. The valve body is held in the high-pressure channel by nut 1 and sealed by beryllium bronze and teflon rings 3. Dents and scratches on the working surface of the valve cap can be worked out with lapping compound. Tests with glycerin and PMS-5 liquid showed reliable operation over long periods. One figure, bibliography of two titles.

"Some Immunological Shifts During Rabies Vaccination"

Tashkent, Meditsinskiy Zhurnal Uzbekistana, No 10, 1972, pp 76-77

Abstract: The effect of rabies vaccination on the dynamics of formation of specific virus-neutralizing antibodies and of autoantibodies to liver, spleen and brain was studied in healthy rabbits. The passive hemagglutination reaction, Nikolaev's method of fractionating the "unprecipitated antigen-antibody" complex and neutralization reactions in white rats were used to measure antibody levels. It was found that autoantibodies began to appear on day 7, peaked on day 21, diminished by day 30 and were rarely detectable on day 37. The specific virus-neutralizing antibodies appeared on day 7, increased markedly between days 14-21 and reached maximal titers by days 30-37.

"Radiation Induced Graft Copolymerization of Methyl Methacrylate From the Vapor Phase Onto Cellulose"

Moscow, Vysokomolekulyarnyye Soyedineniya, Vol 14, No 8, Aug 72, pp 1704-1703

Abstract: The characteristics of grafting copolymerization of methyl methacrylate from vapor phase have been investigated, the main thrust being in the direction of the development of grafting conditions which would preclude the formation of homopolymers. The grafting was studied under conditions of γ -irradiation of the system cellulose-monomer as well as when the preirradiated cellulose was treated with methyl methacrylate vapor. Co^{60} was the source of radiation. It was established that grafting carried out with concurrent irradiation was accompanied by intensive homopolymerization of the monomer. Grafting onto preirradiated cellulose in presence of water vapor proceeds at a higher rate without the formation of a homopolymer. The yield of the grafted copolymer of polymethylmethacrylate depends on the structure of cellulose preparation, decreasing in the order: cotton > flax > ramie.

"Synthesis and Study of Cation Exchange Resins Based on Polycondensation Products of Furfural and Diphenyl Oxide"

Tashkent, Uzbekskiy Khimicheskiy Zhurnal, No 2, 1972, pp 40-42.

Abstract: Condensation-type ion-exchange resins based on furan compounds have high thermal and radiation stability. This work describes the synthesis and study of cation exchange resins by the reaction of polycondensation of diphenyl oxide and furfuran with subsequent sulfuration. The polycondensation process is influenced by the type and quantity of solvent added. The exchange capacity of cationites based on DPO and furfuran in a solvent medium is significantly higher than without the solvent. As the quantity of catalysts -- conc. H_2SO_4 -- added is increased, the exchange capacity increases, apparently due to preliminary sulfuration during polycondensation. The cation exchange resins produced both with and without the solvents had good physical and chemical properties, high thermal and radiation stability.

"Synthesis and Investigation of Anion Exchange Resins Made From the Polycondensation Products of Furfural and Diamines"

Tashkent, Ustekskiy Khimicheskiy Zhurnal, No 5, 1970, pp 84-86

Abstract: The anion exchange resin was obtained by condensing furfural with p-phenylenediamine in presence of dimethylformamide and ZnCl₂. p-Phenylenediamine was dissolved at 60-70° in dimethylformamide in a two-neck flask equipped with a stirrer, reflux condenser and thermometer; ZnCl₂ was added in an excess equal to 2½ of the weight of the reagent. Then a freshly distilled furfural equal to 2½ of the weight of the reagent. Then a freshly distilled furfural was added dropwise. The mixture was kept for 7-8 hrs at 60-70°, the dark gel-like material was placed in a dessicator kept at 110-115° and left there for 24 hrs. The mass solidified in the dessicator; it was ground, washed and dried. The exchange resin thus obtained proved to have good physico-chemical properties and high thermal stability.

Moscow, Svarochnoye proizvodstvo, No 5, May 72, pp 47-48

Abstract: The New MTU-0,4-4 welder is a prototype of the MTU-0.4-3 machine with a redesigned welding head furnished with two types of mechanical oscillatory systems. The new unit is suited for welding plastic components in the radio engineering and electronics industry including micromotors, condensers, batteries, filters, cells, etc. The machine will join plastics with metals by pressing them into polymers, and will weld copper, aluminum, and nickel. The MTU-0.4-3 model has been successfully operated for several years at radio engineering plants and has shown yearly savings ranging from 5000 to 10,000 rubles. The technical specifications for the new ultrasonic model are cited. The serial production project has been assigned to the Kaliningrad Plant of Electrical Equipment. (1 illustration)

"On the Principles of Relation Matching"

V sb. Mat. analiz ekon. modeley. Ch. 3 (Mathematical Analysis of Economic Models. Part 3 -- Collection of Works), Novosibirsk, 1972, pp. 112-125 (from Itogi Matematika, No 3, Mar 73, Abstract No 3V494 by A. MORNELYUBAS)

Translation: Let $A = \{a_1, a_2, \dots, a_n\}$, $n \geq 3$, be a set of alternatives, and $R \subset A \times A = \{(a, b) \mid a, b \in A\}$ a binary relation on A . Let D and E be certain given sets of relations R . $F: D^m \rightarrow E$ (F is a group sampling function, $m \geq 2$) is defined for all $(R_1, R_2, \dots, R_m) \in D^m = D \times \dots \times D$. Certain conditions are imposed on elements D , but it is not required that all $R \in D$ be transitive, while relations in E are assumed to be transitive. Four conditions, which are modifications of Arrow's first four axioms, are imposed on the mapping F . It is proved that if F satisfies conditions 1-4, F is defined by the set of indices $\mathcal{M} = \{1, \dots, m\}$, as follows: $R \in F(R_1, \dots, R_m) \iff R_i$

1/2

MIRKIN, B. G., Mat. analiz. ekon. modeley. Ch. 3, 1972, pp 112-125

Here the meet of any set from D must belong to R.

In particular, conditions 1-4 define dictatorial rule F if and only if
D ⊂ E, but $\{R \mid R = R' \cap R'', \text{ where } R', R'' \in D\} \subsetneq E$.

"The Arrow Approach to the Problem of Matching Opinions"

Matematika i Sotsiologiya [Mathematics and Sociology -- Collection of Works], Novosibirsk, 1972, pp 254-262 (Translated from Referativnyy Zhurnal, Kibernetika, No 1, 1973, Abstract No 1 V664 by the author).

Translation: The axiomatic approach of Arrow to the analysis of the principles of matching individual preferences is extended to the case when the individual preferences are expressed by arbitrary binary relationships. Natural modifications are formulated for the first four conditions of Arrow and an analytic description is presented of all the principles of matching, satisfying them. As a result, a sequence of statements is produced on the possibility or impossibility of matching relationships of various types.

"One Class of Preference Relationships"

Mat. Vopr. Formir. Ekon. Modeley [Mathematical Problems of Formation of Economic Models -- Collection of Works], Novosibirsk, 1970, pp 90-102 (Translated from Referativnyy Zhurnal Kibernetika, No. 4, April, 1971, Abstract No. 4 V526 by A. Morkelyunas).

Translation: The presence of a distinction threshold means assumption that the degree of preference of object $a \in A$ is evaluated not by a single number but rather by an entire interval x_a on the real number axis. This work establishes the property of the binary relationship $P \subseteq A \times A$ (A is a finite set), that (A, P) can be isomorphically represented in some system of intervals on the real number axis between which the binary relationship \leq is defined as follows. For intervals x and y , we assume $x \leq y$ if and only if the left end of interval x is greater than right end of interval y . It is also assumed that $(a, a) \in P$ for all $a \in A$.

It is demonstrated that the system of intervals I with this relationship " \leq " exists and is isomorphic to system (A, P) if and only if

$$P(a) \subseteq P(b) \text{ and } P(b) \subseteq P(a)$$

"Some Problems of a Space of Partitions"

Novosibirsk, Mat. analiz ekon. modeley--sbornik (Mathematical Analysis of Economic Models--collection of works), Ch. 3, 1972, pp 126-147 (from RZh-Kibernetika, No 5, May 73, abstract No 5V426 by A. Lapshin)

Translation: The authors consider the problem of measuring the proximity between different partitions of a finite set of objects. On the basis of some fairly natural conditions the authors introduced a system of requirements to be satisfied by the measure of proximity of partitions, and showed that this system of requirements uniquely characterizes the unknown measure of proximity, namely the Hamming distance between the contiguity matrices of the partitions. A number of expressions are introduced which relate the distances between partitions to specific features of different types. It is found in particular that the mutual relations of ordered

1/2

USSR

MIRKIN, B. G., CHERNYY, L. B., Mat. analiz ekon. modeley, Ch.
3, 1972, pp 126-147

and unordered partitions in the resultant space do not appear sufficiently natural; this shows that the measure of proximity found by the authors should be used very carefully in the presence of arbitrary features, although this does not preclude its use for features of identical type.

The appendix gives an a-program for calculating the measure of proximity between qualitative features of arbitrary type in accordance with formulas given in the article.

"Alkanethiols and Their Derivatives. I. Acid-Base Properties of N-Substi-
tuted β -Aminoalkanethiols"

Leningrad, Zhurnal Obshchey Khimii, Vol 42(104), No 3, Mar 72, pp 662-665

Abstract: The acid-base properties of a number of N-substituted β -amino-
alkanethiols and some related compounds are studied under standard conditions
to evaluate the effect of structural singularities of thiol on the acidity of
the SH-group, and hence on sulfhydryl reactivity. The results of the studies
show that increased acidity of the SH group is determined chiefly by the ca-
pacity of the given compounds to form a zwitter-ion structure, and to a lesser
degree by the nature of the alkyl substituents associated with the nitrogen
atom. The effect of alkyl substituents on the basicity of the amino group
is not so clearly expressed as a consequence of other factors connected with
the inductive effect.

Moscow, Metallovedeniye, No 4, Apr 70, pp 8-15

Abstract: Analysis of steels presently used by the Soviet power industry in both the Soviet Union and abroad indicates that low-carbon low-alloy ferrite-perlite-type steels are best suited to meet the requirements for basic parts of steam boilers and turbines. The maximum total content of alloying elements in these steels is 4 percent. Chromium, molybdenum, and vanadium are the principal alloying elements. Tungsten, niobium, and other elements are used less frequently. Practical experience of operating steam power and gas turbine equipment shows that with strict adherence to the recommended technology of processing and treatment of power equipment components, and proper design and calculation of assembly conditions, the steels would afford 100,000

1/4

USSR

MIRKIN, I. L., et al., Metallovedenie, No. 4, Apr 70, pp 8-15

hours of service. Today's trend of technical progress in power engineering is toward higher operating temperatures and pressures, coupled with ever increasing unit outputs. To meet the new requirements in heat resistance and workability, the development of new steels must be conducted in the following directions: 1) extending and maintaining the service life of the basic solid solution; 2) creating a more stable and slowly precipitating carbide phase in the strengthening phase. In low-alloy steels the carbide phase is the strengthening phase; in medium- and high-alloy steels -- the carbide phase as well as intermetallics (Nb₂Ti, Ti₂N, Ti₂Al₃ phases); 3) strengthening the grain boundaries by microalloying. In the USSR work is presently in progress on establishing ratios of basic alloying elements, such as chromium and vanadium, in steel. Higher molybdenum contents raise the heat-resistant properties of the steel, provided most of it is ferrite and remains so (without going to the carbide phase) for long-term service. For this the basic part of the carbon must be combined with the other alloying elements, such as vanadium, into stable

2/4

USSR

MIRKIN, I. L., et al., Metallovedeniye, No 4, Apr 70, pp 6-15

carbides. The separation of Laves phase particles in austenitic steels requires more time and much higher temperatures than in ferrite steels. This separation contributes to strengthening the steel. Plasticity for the entire service period is an essential characteristic which must be considered when selecting the steel. Creep limit is equally important, as is resistance to fatigue failure. The effort of raising the reliability of long-term service (100,000 hr.) of large power installations requires exact determination of creep rate and time before failure as a function of stress and temperature. The problem is complicated by the fact that during long-term service the heat-resistant steel sustains phase and structural changes, carbide transformation, coagulation of carbide particles, changes in carbide composition and in the basic solid solution with respect to the alloying elements and, finally, changes in its embossstructure. Most of these processes are related to diffusion phenomena. Successful solution of the basic problems in physical metallurgy and the technology of heat resistant steels, as well as advanced designs

"Parametric Amplification and Frequency Conversion in a Two-Section Traveling Wave Tube"

Kiev, IVUZ: Radioelektronika, Vol 15, No 3, Mar 72, pp 290-295

Abstract: A two-section parametric traveling wave tube is considered in which the first amplification section is also a noise transformer for cooling the fast waves of the space charge. An analysis of expressions for the coupling coefficients of the waves in the tube shows that the electron stream can be cooled in the first section while simultaneously attaining high values of gain and conversion. Because optimum operating conditions are only slightly different for minimizing the noise factor and maximizing the gain and conversion factor, the two-section parametric traveling wave tube should make an effective low-noise microwave amplifier.

"Experimental Study of the Velocity and Temperature Fields of a Free Jet of a Jet Engine"

Tr. Ukr. n.-i. gidrometeorol. inst (Works. Ukrainian Scientific Research Hydro-meteorological Institute), 1971, No. 99, pp 72-80 (from RZh-Mekhanika, No 3, Mar 72, Abstract No 3B377)

Translation: The results of an experimental study of the velocity and temperature fields in the initial and basic sections of a free jet of the VK-1 engine are presented. A diagram of the free jet and graphs of the velocity and temperature fields for different cross sections in different operating modes of the engine are constructed. A nomogram is constructed for determining the true velocity of the jet for a given temperature and instrument velocity. It is shown that a change in the temperature of the pickup due to retardation in the range of velocities measured has practically no effect on the magnitude of the true velocity as determined. Deviation is not more than 4%. 13 ref. Author's abstract.

MIRNIK, I.R.

Medical Service

Despite the constant improvement of sanitary-hygienic conditions, especially nutritional, creating a clean tonus of body.

The principal causes for such prevalence are dirty skin damage to the integrity of the skin cover as a result of microorganisms, resulting in suppuration, dermatitis, etc., diseases of the respiratory system, especially nervous tension, etc., diseases of internal organs, the nature of the immunological protection of the body (viruses, bacteria, etc.).

I. G. Parfyonov, Dr. M. Shchedrin, however, investigating conducted in recent years have also established the possibility of nosocomial infection. This is confirmed by clinical observations involving patients of respiratory diseases among noncombat soldiers, a high incidence of pyoderma among personnel in industrial enterprises, miners, etc. Through laboratory research N. V. Chistovitch has established that: 1) under military conditions in humans are a basic natural carrier of pathogenic microorganisms; 2) extensive seeding of the surrounding medium with microorganisms results from carriers who spread the infection via the air-drop method, as well as from individuals with purulent injuries and of exposed parts of the body are more than commonly covered with staphylococci both in well persons and in those suffering from mycoses.

A. N. Fominy came to the conclusion that Staphylococcus aureus highly toxic properties in the environment, because of the high concentration of carbon dioxide in the air being excreted, which in this way serves as a great deal of oxygen, i.e., 50% (approximately). This is apparently what explains the predominance of pathogenic forms in the human environment, the air, various objects, clothing, and skin surface. In this case it could be assumed that individual differences from one place to another in the respiratory tract would be spreading highly pathogenic staphylococci and streptococci (especially while coughing or sneezing).

And, indeed, in analyzing the incidence of disease in military units, we noted an almost constant relationship in increase in pyoderma. In those cases where there was a high incidence of asthma and sinus, respiratory diseases such as the flu, acute rhinitis, pharyngitis, laryngitis, bronchitis, and bronchitis. The rise in the incidence of pyoderma during the fall and winter months, as a rule, coincided with an increase of acute respiratory infections. Pyoderma is most frequently encountered in those cases where the disease is the result of a staph infection following rhinophyma, furunculosis, with predominant localization in the exposed parts of the body.

B. I. El'kin attributes the development of skin abscesses to occupational boiling of the hands. He found microorganisms to be the direct cause of such infections in 10 percent of the cases. I. G. Shchedrin attributed the increased incidence of suppurative diseases among the population during the influenza pandemic of 1957 to a decline in the natural

connection between structural masses
and the human skin to the air.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE FLOW OF A CURRENT THROUGH AN INHOMOGENEOUS PLASMA IS CONSIDERED UNDER CONDITIONS WHEN THE ELECTRON MEAN FREE PATH CONSIDERABLY EXCEEDS THE CHARACTERISTIC INHOMOGENEITY DIMENSIONS. IT IS SHOWN THAT THE PRESENCE OF A LARGE NUMBER OF CAPTURED ELECTRONS LEADS TO A STRONG INCREASE OF THE OHMIC RESISTANCE COMPARED TO THE CASE OF A HOMOGENEOUS PLASMA. THE EFFECTIVE CONDUCTIVITY IS CALCULATED BY SIMULTANEOUSLY TAKING INTO ACCOUNT ELECTRON-ELECTRON AND ELECTRON-HOLE COLLISIONS. THE SPATIAL DISTRIBUTION OF THE ELECTRIC FIELD APPLIED TO THE PLASMA IS FOUND. INSTITUT YADERNOY FIZIKI, SIBIRSKOGO OTDELENIYA, AKADEMII NAUK SSSR.

"Method Of Application Of Vacuum--Multilayer Insulation"

USSR Author's Certificate No 298790, filed 8 May 68, published 14 May 71 (from
RZh:Elektronika i yeye primeneniya, No 1, Jan 72, Abstract No 1A454P)

Translation: A method is proposed for application of vacuum--multilayer insulation on vessels of cylindrical form for storage of cryogenic liquids, by virtue of which strips of insulation are wound on the lateral face of the cylinder and insulating disks are applied at the bottom of the vessels. The method differs in the fact that with the object of increasing the productivity of labor and simplification of the installation of insulation for insulated bottoms, disks are used with a diameter larger than the diameter of the vessel, the protruding edges of which are cut into rectangular tongues and then turned back into the cylindrical part of the vessel and overlapped with respect to the perimeter of the insulation strips.

No 48, Dec 73, Author's Certificate No 409245, Division G, filed 24 Apr 72,
published 30 Nov 73, p 121

Translation: This Author's Certificate introduces a device for modeling a neuron. The device contains a power supply and integrators. As a distinguishing feature of the patent, the device is simplified by adding a balanced differential amplifier covered by negative and positive feedback loops. Connected to the first input of the amplifier are integrators and a scaling resistor unit and also switching elements whose controlling inputs are connected to the power supply. The first output of the balanced differential amplifier is connected to the output of the first switching element, while the second output of the balanced differential amplifier is connected to the output of the second switching element, which is connected in turn to the first switching element, to the zero potential line, and to the second input of the balanced differential amplifier.

"The Number of Information Symbols in Polynomial Codes"

Tr. Leningr. In-t Aviats. Priborostroj. [Leningrad Institute of Aviation Instrument Building], 1972, No 74, pp 60-70 (Translated from Referativnyy Zhurnal Kibernetika, No 11, 1972, Abstract No 11V371, by V. Zinov'yev)

Translation: The polynomial codes introduced by Kasami, Lin and Peterson have been studied by many authors. This class of codes is interesting in that it includes many known classes of codes such as R-M codes, BFC codes, dual geometric codes, etc. The purpose of the present article is to describe a simple method of determination of the number of information symbols in polynomial and other related codes. In certain particular cases, this method leads to simple recurrent or explicit formulas which are either known or generalizations of known formulas, or are new. For example, a formula is produced for the number of information symbols in the case of Euclidean geometric codes.

Gabidulin).

Translation: Real functions defined in elements of a finite Abelian group and their Fourier transforms are studied. In particular, the distributions of probability are fixed in the group and the problem of decoding error is studied. Characteristic functions (Fourier transforms of the probability distribution) are used to describe a broad class of channels including a channel without memory, and the upper boundary is produced for the probability of false decoding. Let us present a characteristic partial result: for a binary symmetrical channel, the probability of error has the estimate

$$P_e < \sum_{w=1}^n N(w) (2\sqrt{p_0 q_0})^w, \text{ where } p_0 \text{ is the probability of error in a symbol, } N(w)$$

Measurement of Turbulent Moisture Fluxes with IR Hygrometer

(Abstract: "Measurements of Turbulent Moisture Fluxes with an Infrared Hygrometer," by L. G. Yelagina, V. I. Gorshkov and N. T. Mikkonenko, Institute of Physics of the Atmosphere; Moscow, Izvestiya Akademii Nauk SSSR, Fizika Atmosfery i Okeana, Vol VI, No 1, 1970, pp 92-95)

During the summer of 1968 the State Hydrological Institute made systematic measurements of moisture fluxes with an infrared hygrometer at the Valday Scientific Research Hydrological Laboratory for comparing the results with data obtained using the large-model hydraulic evaporator. The latter instrument is a precise apparatus for measuring evaporation from the earth's surface by constant weighing. The instrument's surface area is 5 m² and it holds a monolith of earth weighing 40 tons; weighing accuracy is 5 grams. The spectroscopic method, based on water-vapor absorption of radiation in the IR region, has advantages in comparison with other methods for measuring humidity; in particular, it is direct, inertialless and suitable for determining humidity at below-zero temperatures. On the other hand, it is difficult to use because the transmission function of water vapor in the working region of the spectrum must be measured with

12

Reel/Frame

4 1/2, 11, 25

AP0042563

a great accuracy and it cannot be used in measuring relative humidities close to saturation. The results given in this paper were obtained using the water vapor absorption band at 1.9μ . Detailed results obtained under specific circumstances are given. The distance between the compared instruments, the IR hygrometer and the large-model hydraulic evaporator, was 1.5 km. It was found that the mean daily values of the moisture fluxes as registered by the two instruments were quite close.

"A Procedure for Predicting the Uniformity of the Luminescence
Color of a BM-5 Phosphor Coating"

Sb. nauch. tr. VNII luminoforov i osoboi chist. veshchestv (Col-
lected Scientific Works of the All-Union Scientific Research
Institute of Phosphors and Extra Pure Materials), 1971, vyp. 5,
pp 125-132 (from RZh-Khimiya, No 7, Apr 72, Abstract № 71173)

Translation: It was established by physical and chemical methods that in applying batches of new BM-5 luminescent compositions made by chemical plants, the large fraction settling on the screen frequently contains an excess of the composition with yellow luminescence color. For such batches of BM-5, the luminescent color of the screen is typically round form with a whitish spot in the center. A method is proposed for evaluating the uniformity of BM-5 luminescent composition with respect to the uniformity of the luminescence color on the screen separated from the BM-5. The procedure is based on separation into component parts followed by analysis of the parameter of uniformity.

"Using Open Cylindrical Limited Resonators for Investigating the Dielectric Characteristics of a Material"

Kiev, Izvestiya VUZ -- Radioelektronika, Vol. 15, No. 10, 1970,
pp 1085-1091

Abstract: Interest has been aroused by the ability of resonators of this type to find the dielectric capabilities of moving gaseous media as well as solid, liquid, or powdered substances partially or completely filling the resonator space. In the case considered by this article, the dielectric is in the shape of a cylindrical rod placed coaxially with the resonator and partially filling it. The measurement and its method are analyzed only for the case of type H_{01} oscillations. In the theoretical analysis, the walls of the circular cross-sectioned resonator are considered to be infinitely long. After the theoretical portion of the article, in which formulas are obtained for determining the parameters of solid, liquid, and powdered substances, there is an experimental

1/1

section giving details of the equipment and results of such measurements made with a resonator of finite length, 20 mm, and cut in the form of a cylindrical waveguide of 20 mm in diameter. A diagram of the resonator and a block diagram of the associated equipment are given. Also presented is a table of the results of the experimental work performed on a number of materials including ebonite, textolite, granulated table salt, and the like. The authors note that they also obtained formulas for determining the concentration of the plasma partially filling the resonator, and the effective collision frequency between the electrons and heavy particles. These formulas and the results of corresponding experiments are being separately published.

DISORDER IN ACCEPTOR FUNCTION OF TRANSFER RNA's FROM RABBIT
LIVER AT INSULIN INSUFFICIENCY

Ya. L. Germanguk, V. I. Mironenko

The Laboratory of Biochemistry Research Institute of Endocrinology and Metabolism, Kiev

The insulin insufficiency by means of alloxan administration has been induced in rabbits. From livers of both diabetic and healthy animals the total sRNA and aminoacyl RNA-synthetases have been isolated. The level of aminoacyl sRNA formation was studied. It was noted that "diabetic" sRNA less effectively accepts I-C^{14} -lysine, I-C^{14} -arginine and I-C^{14} -leucine under catalytic action of "diabetic" as well as "healthy" aminoacyl RNA synthetases. At the same time "healthy" RNA's with "healthy" synthetases do it more readily. From these results one may conclude that one of the possible reasons for decreased level of aminoacyls sRNA formation in the liver of animals with insulin insufficiency is transfer RNA itself.

"Hygienic Evaluation of Materials for Decontamination and Enrichment of
Demineralized Water with Salt"

Moscow, Gigiyena i Sanitariya, No 8, 1972, pp 19-22

Abstract: Results are presented from a hygienic evaluation of A V - 7 x 8ch S anion-exchange resin in bicarbonate form and the contact granulated M-16 mineralizer for enrichment of desalinated water with salt and the asbestos-silver sterilizer for decontamination of desalinated water. The use of water which has been enriched with salt and decontaminated by the mentioned materials for drinking purposes is acceptable for a period of no more than 30 days. The procedures for applying the indicated materials for the mentioned purposes and testing the water obtained are described. The results of the sanitary-chemical, sanitary-bacteriological and sanitary-toxicological studies provide a basis for recommending AV-17-8chS anion-exchange resin (in bicarbonate form) and the M-16 granulated contact mineralizer as reagents for enriching water with salt for short-term utilization of it for drinking purposes. In connection with salt for short-term utilization of it for drinking purposes. In connection

with absence in the mineralizer of fluorine compounds, the water cannot be used for drinking purposes over a prolonged period of time. The investigated asbestos-silver sterilizer is in need of further improvement in that its present output of silver ions is low and unstable. White rats were used to study the physiological effects of drinking the treated water.

"Prospects for the Development of New Heat-Resistant Materials
for Steam Power Energy Equipment"

Moscow, Metallovedeniye, No. 4, Apr. 70, pp. 5-15.

Abstract: Analysis of steels currently used by the power industry in both the Soviet Union and abroad indicates that the carbon low-alloy ferrite-perlite-type steels with 0.25 percent carbon meet the requirements for basic parts of steam-turbine units and combines. The maximum total content of alloying elements in these steels is 4 percent. Chromium, molybdenum, and vanadium are the principal alloying elements. Tin, niobium, and columbium are used less frequently. Practical experience shows that with the use of steam power and gas turbine equipment there is no problem adherence to the recommended technology of preparing the material, treatment of power equipment components, and proper design. In consideration of assembly conditions, the steels would afford 400,000 l/4
